

Website – PHP (English)

Summary:

It is a professional application where customers can make requests that are forwarded to the company's internal systems, to be processed and subsequently made available back at this same web application.

The main features of this system are:

- Hash code to protect passwords and sensitive data.
- Use of PDO to manipulate the database (effective against sql injection).
- Google's captcha to protect the login page (shows up at third try).
- Use of private external APIs in real time.
- Invoice generation.
- Billet generation.
- Reports generation (pdf and excel).
- Sending emails.
- File management at server side and exportation.

The main Technologies applied are:

- Js/JQuery
- PHP7
- MySQL
- Composer
- CSS/Bootstrap
- Nginx
- SMTP
